PVC WINDOWS, DOORS and SHUTTER SYSTEMS

innovation

more sustainable insulating Windows with **CRP**

Composite Re-inforcement Profile

**WELDED
CORNERS**

more

durable
practicable
economical
fast production

extra strength
with corner
welding (4, 4 mm)

PROFILE FEATURES

- CRP is a new way of re-inforcement for PVC profiles.
- Unlike the metal re-inforcement profiles CRP could be welded like PVC which increases the corner resistance considerably.
- Advantages of CRP fitted inside a PVC profile;
- More insulation.
- No screws inside, therefore no corrosion.
- Ease the transportation of re-inforcement because it is already fitted in the PVC profile.
- The total production time will be reduced.
- Unlike the traditional re-inforcement profile the innovation of CRP brings maximum resistance.
- Unlike the traditional re-inforcement profile CRP is 100% corrosion and maintenance free.
- CRP prevents the drooping of the doors and the moving sashes due to its unique feature of welding in the corners.
- The test results of CRP are much higher than 1,5 mm thickness re-inforcement profiles.
- Because of the high sound and noise isolation values, CRP is considerably better than the traditional re-inforcement profiles.
- Because its not metal, during the cutting process the same fraise knives for PVC could be used.
- Because its minimum twice thicker, the screws fix PVC profiles much stronger compared to 1,5 mm thickness metal, re-inforcement profiles.
- In conclusion, our new practical invention which is of European quality certification is presented to your interest with its high quality, and competitive price.
